

MEMORANDUM

To: Mayor and City Council

From: Michael Smith, Public Works Director

Date: December 8, 2014

Subject: **Discussion of 2015 Paving Plan**

ITEM DESCRIPTION

Discussion of the 2015 paving plan and updates to the Five Year Paving Plan.

BACKGROUND

At the end of 2013, IMS Infrastructure services working on behalf of the City completed an update to the citywide pavement condition assessment. The update consisted of traveling every city street with a Road Surface Tester (RST) truck equipped with lasers, cameras and other sensors to evaluate the extent and nature of cracking, rutting, roughness (ride quality) and other factors such as drainage conditions. These factors were then weighted and combined to produce a numerical pavement condition rating/index (PCI) between 10 (worst) and 100 (best). Key findings from the most recent assessment include:

- There has been significant improvement in the condition of arterial and collector roads. The percentage of pavement area in good to excellent condition for these roads increased from 45% to 60%. The percentage in poor condition remained roughly the same.
- By area, the percentage of neighborhood streets in poor condition has grown from 15% to 45%.
- Overall about one third of City streets are in good to excellent condition and about one third are in poor to very poor condition. The remaining third are in fair condition. The overall pavement condition rating is 66 compared to 69 in 2009.

As a result of these findings the city council decided to allocate an additional \$400,000 on an annual basis beginning in 2015 specifically for additional neighborhood street paving.

DISCUSSION

2015 Paving List

Through adoption of the 2015 budget, the city council increased the funding for paving to \$2,600,000 including state funding through a Local Maintenance and Infrastructure Grant (LMIG). As a result, five neighborhood streets have been moved up the five year list to 2015 as indicated in the Notes column of the 5-year Paving Plan. One street has also been added for major patching and two streets have been added for preventative maintenance.

Complete Streets Analysis

In accordance with the City's Complete Streets Policy, all of the roads on the 2015 paving list that are included on the bicycle network in the City's Comprehensive Transportation Plan will be evaluated for a bicycle lane retrofit as part of the paving project. The applicable roads for 2015 are Tilly Mill Road, Vermack Road and Valley View Drive. A preliminary review indicates that Tilly Mill Road will require widening in conjunction with adding curb, gutter and sidewalk on the west side of the road in order to provide enough pavement width to add bike lanes. The feasibility and costs of widening the pavement will be evaluated as part of the sidewalk design. Cycling conditions can be improved on Vermack Road by narrowing travel lanes to 10 feet. Valley View Drive has lower traffic volumes and is suitable for bike route signage and sharrow pavement markings.

Five Year Plan Update

The five year paving plan presented in Attachment "A" has been updated by adding a list of streets for paving in 2019 and by adding preventative maintenance for previously paved arterial and collector streets. Other minor revisions are noted in the Notes column. In prioritizing neighborhood streets staff considered the pavement condition ratings as well as the recommendation from the assessment report to group stretches of road that have differing years of rehabilitation but that are in close geographic proximity to each other.

In past year the City's goal has been to target 70% of the paving funds each year to the arterial and collector streets because they receive the most traffic and are the most expensive to repair. As more of these streets are repaved each year, it becomes more beneficial to allocate a higher percentage of the funds to neighborhood streets, and the 5 year plan reflects this. By 2019 most of the arterials and collectors will have been resurfaced once and the recommendation is to allocate all of the funding for neighborhood streets for that year.

The proposed five year plan strives to sustain the progress made on the arterial and collector roads while increasing the funding over previous years for neighborhood streets to address the backlog. Staff has also developed a supplemental list of the lowest rated neighborhood streets that could easily be added each year should surplus funds become available. These streets were selected based on their current condition, proximity to other planned paving and relation to nearby capital projects.

RECOMMENDED ACTION

Staff recommends approval of the five year paving plan.

PAVEMENT CONDITION REPORT

Data Calculation - The surface of the pavement is typically tested using the Laser Road Surface Tester (RST). This device consists of various sensors and lasers specialized for collecting data related to surface distress. This data is augmented by subjective analysis. Data on cracking, rutting, roughness (ride quality) and external factors are calculated during the surface condition survey. This data is then processed to produce various condition numbers, which are shown in the Pavement Condition Report.

The Pavement Condition Report gives detailed information about each individual section of pavement. This listing is also in numerical order by section number, and includes the street name and limits. The numerical fields, and their relative values, are described in more detail below.

RUT CONDITION An average rut depth for the section is calculated in real time by the RST. A percentage of distance where the rut exceeded 10 mm and 20 mm is also recorded which allows analysis of localized ruts. These figures are combined using an algorithm, which yields a RUT condition number between 10 and 100 where 100 is the best.

ROUGHNESS CONDITION In order to calculate the Ride Quality Number, 3 devices are used. The lasers in the wheel path continuously measure the distance from the vehicle to the pavement. An accelerometer is integrated to determine the continuous vertical position of the vehicle. A distance measuring device is used to record the position and velocity of the vehicle. These figures are used to calculate the longitudinal profile of the pavement in the time domain. A theoretical roughness model is then superimposed on the profile to determine the quality of the ride, as perceived by passengers. The "RQ" rating varies from 10 to 100, where 100 is best.

CRACK CONDITION The CRACK rating figure, varying from 10 to 100 where 100 is best, is based on the size, number, and types of cracks objectively counted and measured by the laser test vehicle or manual collection. The crack number also includes the influence of other surface defects such as raveling and bleeding.

EXTERNAL CONDITION There are parameters collected during the surface collection that deal with conditions off the pavement that affect pavement deterioration these include climate zone, pavement edge profile, shoulder or curb condition and drainage condition. These parameters combine to form an external condition number.

SURFACE CONDITION Rut, Roughness and Crack conditions are weighted and combined to form the Surface Condition number.

PAVEMENT CONDITION The surface condition along with any structural condition information provided are weighted and combined then external conditions are deducted to form the Pavement Condition Number. This number, like all other condition numbers, ranges from 10 to 100 where 100 is best.

RUT DEPTH The rut depth is listed in terms of average depth for the block section in inches.

IRI The International Roughness Index is listed for each block section indicating the inches of vertical roughness per mile traveled down the pavement.

Note: The data has not been aged and therefore reflects the condition **IN THE YEAR IT WAS TESTED.**
